

01 Generate Schedule

The Generate button rebuilds only safe-to-rebuild future pending work. Active, historical and reviewed records keep their identity.

02 Field worker job lifecycle

One worker claims an ordinary job when starting it. All-Teams work remains collaborative and records a separate completion for each team.

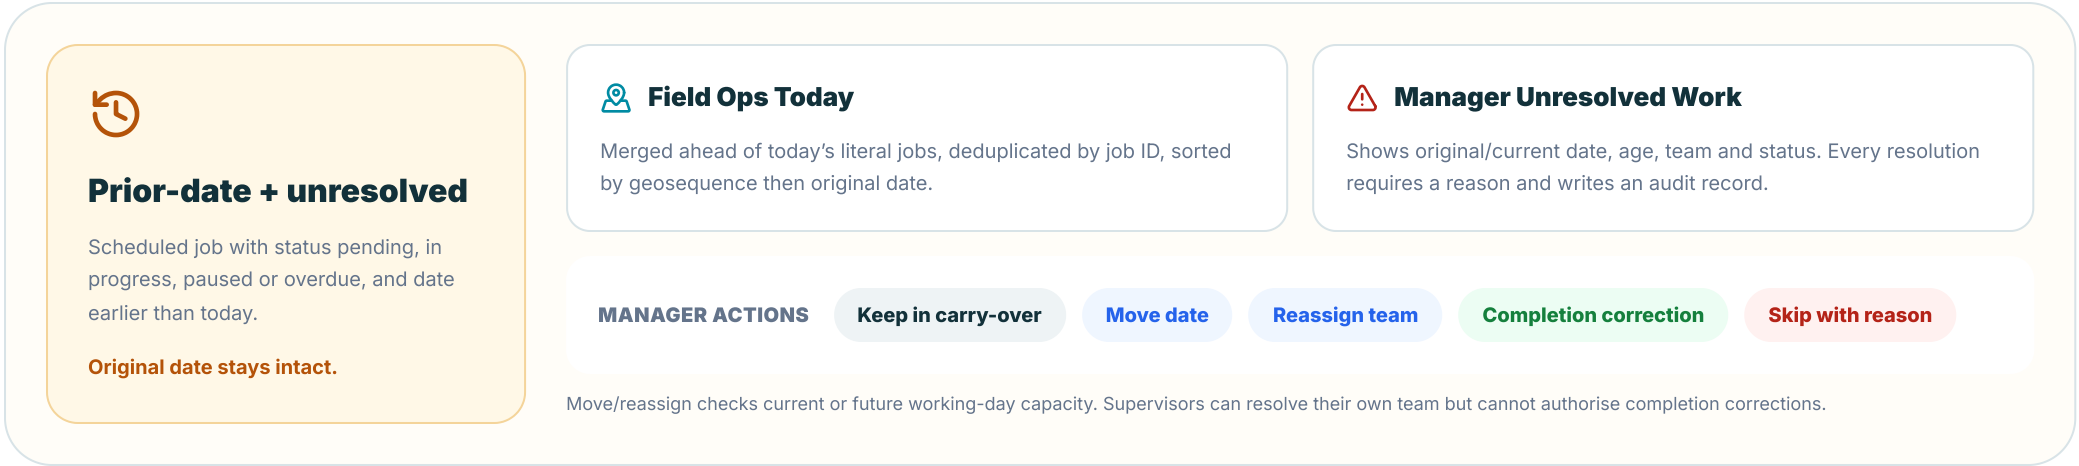

03 What happens after a worker skips?

A skip is not silently regenerated. Management makes an explicit accept/reject decision, and acceptance creates a deliberate placement workflow.

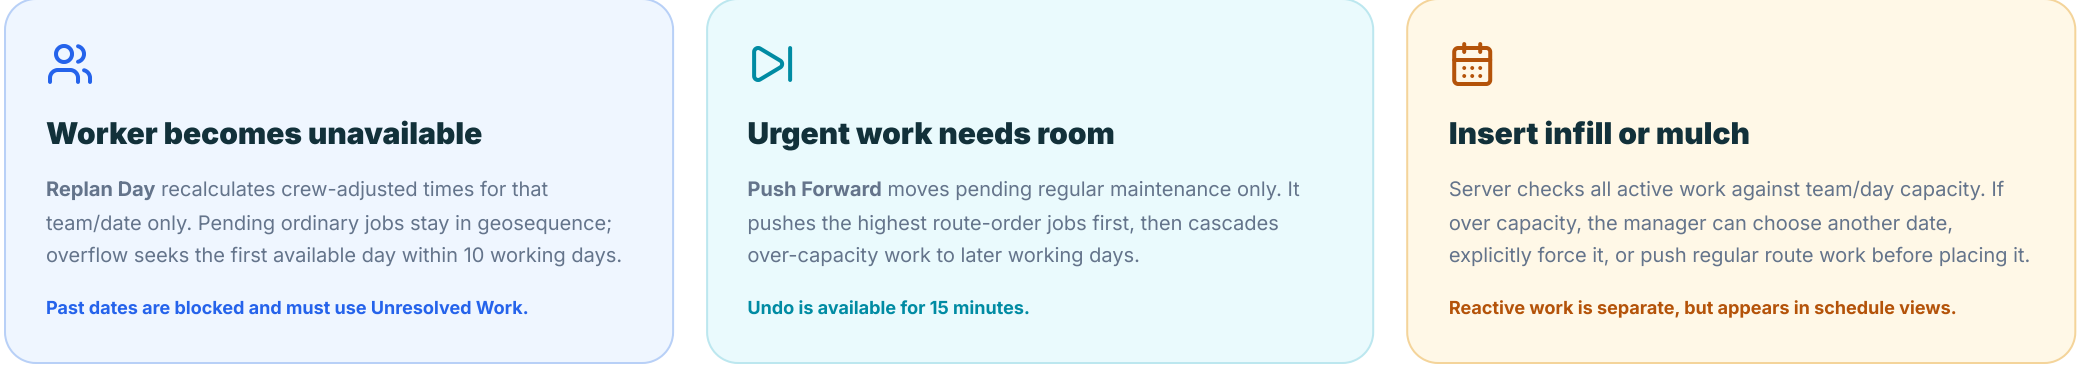

04 When scheduled work passes its date

Missed work is carried forward for action without changing its scheduled date. Managers can resolve it, but generation cannot erase it.

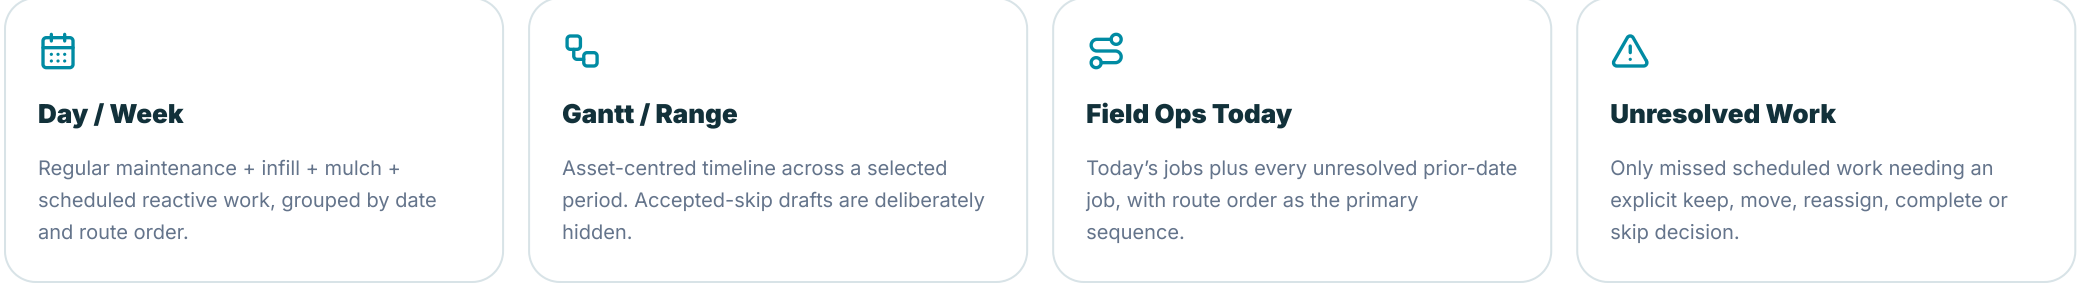

05 Capacity changes & manual insertions

These flows alter a narrow part of the plan rather than regenerating everything.

06 What each schedule surface is showing

The same underlying work is presented differently depending on whether the goal is planning, route execution or exception resolution.

STATUS KEY

Pending: ready / remaining

In progress: claimed

Paused: timer stopped

Completed: terminal history

Skipped: reviewable history

Draft: accepted skip awaiting placement

The mental model:

generation creates the route; workers advance job state; managers resolve exceptions; capacity tools move only pending future work; audit/history protects what actually happened.
